

# AI Modules — Voice, Narrative, World, Public Opinion

## Common pattern (all 4 modules):

- Each has its own page route (e.g. /character/[id]/voice)
- Each has its own Client component + API route
- All use SSE streaming with chatCompletionStream
- All use useAiSettings() for provider/model/apiKey
- All have custom system prompts (editable in AppSetting)
- All have AbortController + 90s timeout
- All have their own PromptsPanel for prompt editing
- All save to database via Server Actions

### VOICE MODULE

- VoiceClient.tsx
- API: /api/ai/voice (POST SSE)
- Prompt: prompt/prompt\_dialog.md or VOICE\_PROMPT
- Generates: 8-10 dialogue scenes showing character voice in different situations
- Output: raw markdown in textarea auto-saved to character.voice
- Typewriter effect with scroll lock

### NARRATIVE MODULE

- NarrativeClient.tsx
- API: /api/ai/narrative (POST SSE)
- Prompt: NARRATIVE\_PROMPT from AppSetting
- Generates: literary prose description of character
- Output: HTML/markdown with typewriter
- Saved to character.narrative via updateCharacterNarrative

### WORLD MODULE

- WorldElementForm.tsx
- API: /api/ai/world (POST SSE)
- 2 modes: Generate (new) + Expand
- Categories: location, faction, history, rule, dictionary, other
- Prompts: WORLD\_SYSTEM\_PROMPT, WORLD\_GENERATE\_PROMPT, WORLD\_EXPAND\_PROMPT
- Output: free text, auto-saved via updateWorldElement

### PUBLIC OPINION MODULE

- PublicClient.tsx
- API: /api/ai/public (POST SSE)
- Prompt: PUBLIC\_PROMPT from AppSetting
- 5 roles: friend, acquaintance, colleague, partner, ex
- Input: full character data + narrative
- Output: opinions per role in markdown → parsed to form fields
- Saved via updateCharacterPublicOpinions

## All 4 share the same data flow pattern:
